

Instagram Engagement Analysis Report

1. Executive Summary

This project analyzes Instagram engagement data to understand how users interact with content through likes, comments, hashtags, and follower behavior. The objective is to identify patterns that can improve content strategy and audience engagement.

2. Data Preparation

- Combined datasets covering users, photos, likes, comments, and hashtags.
- Standardized column names and verified data consistency.
- Calculated engagement metrics such as likes, comments, and engagement rate.
- Normalized engagement by follower count for fair comparison.

3. Key Findings

Likes represent the majority of engagement, while comments indicate deeper user interaction. Engagement rates vary even among users with similar follower counts, emphasizing content quality.

Hashtag usage analysis shows that a moderate number of relevant hashtags leads to better engagement compared to excessive or no hashtag usage.

Engagement is concentrated among a small group of highly active users, suggesting opportunities for influencer-focused strategies.

4. Recommendations

1. Prioritize content formats with higher engagement rates.
2. Use 5–10 relevant hashtags per post for optimal reach.
3. Focus on engagement rate rather than raw likes.
4. Encourage comments using interactive CTAs.
5. Maintain a consistent posting schedule.
